

1. Subscription & License Management

- **Symptom:** "License Limit Reached" error when adding new support agents. Resolution: Navigate to Admin Console > Billing > Subscriptions, click "Modify Seats," and purchase additional user licenses. Enterprise tiers auto-scale up to 10% over-limit before blocking.
- **Symptom:** Annual renewal payment failed due to expired credit card. Resolution: Update payment details under Billing > Payment Methods. The system automatically retries failed charges every 24 hours for 3 days before suspending cloud sync services.

2. Two-Factor Authentication (2FA) & SSO Issues

- **Symptom:** Agent locked out of account after losing authenticator device. Resolution: Admin must go to User Management, select the affected agent's profile, and click "Reset 2FA/MFA Token." This forces a mandatory 2FA re-enrollment on their next login.
- **Symptom:** Single Sign-On (SSO) SAML assertion failure. Resolution: Verify that the IdP (Identity Provider) metadata XML certificate has not expired. Re-upload the updated metadata file under Security > Authentication Settings.

3. API Rate Limiting & Integration Errors

- **Symptom:** External webhook timeouts or HTTP 429 errors during high-volume syncs. Resolution: Implement exponential backoff in your API client code. The standard rate limit for the cloud portal API is 100 requests per minute per organization token.
- **Symptom:** Salesforce LWC integration failing with HTTP 401 Unauthorized. Resolution: Verify that the Bearer token or API key stored in your secure custom settings hasn't been rotated or revoked in the developer portal.
